

FUNDAMENTALS OF BIOMETEOROLOGY

INTERACTIONS OF ORGANISMS AND THE ATMOSPHERE

Volume 2: The Biological Environment

WILLIAM P. LOWRY and PORTER P. LOWRY II

Forward

Preface

10. Plants and the Atmosphere: Physiology

Introduction	1
Efficiencies related to photosynthesis and respiration	5
Leaf anatomy	9
Photosynthesis	11
The flow of carbon dioxide in photosynthesis	18
Respiration in plants	21
Photosynthesis and respiration under field conditions	23
Transpiration and stomatal behavior	27
Feedback loops involving stomatal control	35
The energy balance of a leaf	39
Soil conditions and physiological processes	45
Plants under stress	52
Plants and wind	60
Box 10-1: Anatomical and physiological adaptations of certain tropical plants	64
Box 10-2: Basic mathematical modules for net photosynthesis and stomatal behavior related to light and carbon dioxide	66
Box 10-3: Experimental techniques used in quantitative research on photosynthesis, respiration, and transpiration	69
Box 10-4: Modeling the energy balance of a leaf	75
Box 10-5: A critical analysis of models connecting soil moisture content and the rate of evapotranspiration	89
Box 10-6: An overview of plants under environmental stress	93

11. Plants and the Atmosphere: Growth and Development

Introduction	96
Environmental optima and limits	97
Thermoperiodism	98
The Heat Units Concept	105
Phenology	108
Effects of soil moisture on plant productivity and yield	113
Water use efficiency	118
Responses of plants to aridity and drought	120
Box 11-1: A theory of the heat units concept	132
Box 11-2: Phenology: history, status, and problem analysis	135
Box 11-3: Crop modeling	146
Box 11-4: An overview of drought	152

12. Management of Plant Microenvironments

Introduction	159
Site selection	162
Heat trapping	162
Shading	168
Supplementary heat	169
Reduced convection	174
Changing soil properties	179
Changing plant properties	185
Irrigation: modeling and scheduling	188
Irrigation: general considerations	193
Concluding remarks	194

13. Animals and the Atmosphere: Some Basic Principles

Introduction	198
Atmospheric effects on animals	198
The animal life cycle	199
Comparative biometeorology of plants and animals	200
Energy controls available to animals	204
The importance of body size in animal biometeorology	208
The Preferendum	216
The cruising speed	218
Concepts related to the use of space by animals	219
Rate of development as a function of the atmospheric environment	221
Animal populations and the atmospheric environment	222
Box 13-1: Analysis of the relationships among animal weight, surface area, and metabolic rate	230

Box 13-2: The thermal time constant as related to responses of animals to varying environmental temperature	236
Box 13-3: Allometric scaling: an example related to the energetics of animal movement and locomotion	243
Box 13-4: An essay on animal population ecology	249

14. Animals and the Atmosphere:

Small Animals including Insects

Introduction	265
Thermal optima and limits	266
Short-term effects: the Preferendum	271
Short-term effects: the Cruising speed	276
Long-term effects: the rates of development and survival	276
Long-term effects: reproductive success	282
Enduring atmospheric adversity: migration as a defense	285
Enduring atmospheric adversity: acclimation and dormancy as a defense	286
Enduring atmospheric adversity: polymorphism as a defense	299
Enduring atmospheric adversity: theoretical considerations	300
Evaporative cooling and the animal energy balance	301
Modeling the energy balance of a small animal	302
Concluding remark	307

Box 14-1: The Preferendum as a behavioral response to differences in the biometeorological environment	314
Box 14-2: Calculations with heat units as applied to the phenology of an insect	318
Box 14-3: Comments on five functional relationships in developmental biometeorology	321
Box 14-4: Calculations with the basic model for the energy balance of a small animal	328
Box 14-5: Climate Space	338

15. Animals and the Atmosphere:

Large Animals including Man

Introduction	342
Atmospheric effects on the Preferendum of large animals	343
The metabolic work rate and body temperature in Man	346
The variable thermal conductivity of body and coat in a large animal	351
Evaporative cooling in a large animal	354
The structure and use of a model for the energy balance of a large animal	359
The areas involved in a model of the energy balance	360

Mathematical modeling of the energy balance of a large animal	362
Effects of aging and physical condition in Man	370
Concluding remarks	371
Box 15-1: Calculations with a model for the energy balance of a large animal	378
Box 15-2: A note on resistance and conductance	387
Box 15-3: Experimental techniques used in quantitative research on the energy balance of an animal	390
16. Man's Personal Climate:	
Comfort, Clothing and Housing	
Introduction	398
Human comfort: a functional overview	399
Human comfort: quantifying the comfort zone	402
Quantifying human discomfort: methods and problems	406
Quantifying human discomfort: equivalence and equivalent temperatures	413
Quantifying human discomfort: low temperatures	415
Quantifying human discomfort: high temperatures	418
The ultimate human discomfort: morbidity and mortality	420
Mathematical modeling of the human energy balance	426
Clothing, housing, and the human energy balance	428
The role of clothing	430
The role of housing	438
Housing in extratropical climates	441
Housing in warm tropical climates	444
The energy implications of architecture	448
Concluding remarks	454
Box 16-1: Indices of thermal comfort: types, advantages and disadvantages	465
Box 16-2: Wind chill and the Wind chill Equivalent temperature	479
Box 16-3: An experimental comparison of observations and modeling of human comfort	485
Box 16-4: Heating and Cooling Degrees as climatological indices of the demand for energy to maintain indoor human comfort	489
17. Man's Regional Climate: Urban and Industrial Effects	
Introduction	496
Basic terminology of urban climatology	497
Establishing the existence of urban effects on climate	498
Explaining urban effects on climate	512

The current status of urban climatology	528
Urbanization and the regional metabolic rate	534
Human perceptions of air pollution	542
Biometeorology for urban and regional planning	547
Concluding remarks	551
Box 17-1: Historical notes on the development of urban climatology	563
Box 17-2: An essay on the methodological problems of detecting and explaining urban effects on climate	566
Box 17-3: A note on the urban metabolic rate	573
18.A Look Backward and a Look Forward	576
Appendices	
A. Quantification of the Earth-Atmosphere Biophysical System in Figure 10-2	583
B. Physical Units and Constants	586
C. A Comparison of Modules for the Convective Transfer of Sensible Heat (H) and Latent Heat (LH) in Models of Energy Balance	589
D. Notes on Biometeorological Instrumentation	607
E. Mathematical Proofs and Derivations	618
References	631
Mathematical Symbols	641
Problems	653
Author Index	665
Subject Index	670
